TARA / DIGITAL COMMERCE

Project overview & client approval

A concise description of the customer storefront, administration tools, technology, delivery boundaries, and formal sign-off.

Document purpose
Use this document to review the project scope and record client acceptance. It describes capabilities found in the current codebase; it is not a statement that external services, live credentials, production data, or courier integrations have been configured or independently accepted.

PROJECT AT A GLANCE

Area	Current implementation
Customer experience	Responsive fashion storefront with product discovery, cart, checkout, customer account entry points, and order services.
Admin operations	Protected admin dashboard for catalogue, orders, store content, customer requests, refunds, and reports.
Architecture	React + Vite browser application, Express API, PostgreSQL/Neon data layer, and Supabase Auth integration.
Payment provider	Razorpay integration in code; merchant credentials, webhook setup, and live-mode approval are deployment responsibilities.
Approval status	Client sign-off fields are provided at the end; launch readiness depends on the listed configuration and acceptance checks.

Prepared from the current project source and its setup documentation. No customer credentials or secret values are included in this document.

01 / CUSTOMER EXPERIENCE

Customer storefront & account

Customers can discover the Tara catalogue, select product variants, manage a shopping bag, and proceed through online or eligible cash-on-delivery checkout. Public shopping is intended to remain available to guests; account-only data and actions require authentication.

Capability	What the customer can do
Browse & discover	View product catalogue and categories; search, filter, sort, and browse collections; open product details; view prices, available sizes/variants, stock indicators, and product imagery.
Find Your Style	Browse homepage category cards. Admin-managed collections support image, caption, destination, order, visibility, and product association controls where configured.
Wishlist & cart	Save products, add a selected size/variant to the cart, update quantities, remove items, and continue shopping. Guest cart state is kept in the browser.
Checkout	Enter delivery and contact details; apply eligible coupon codes; submit guest or signed-in checkout; pricing and stock are recalculated by the API.
Payment	Choose online Razorpay checkout when configured, or COD only when enabled by store configuration. Online payment verification is performed server-side.
Orders & support	View account orders when linked to the signed-in customer; track order status using the order number; submit eligible cancellation, return, or exchange requests.
Customer account	Supabase Auth sign-up/sign-in and persistent session support; account API includes profile, order, address, wishlist, and notification data endpoints.
Reviews & updates	Read approved reviews, submit a product review for moderation, subscribe to the newsletter, and receive order/request notifications where delivery channels are configured.
Shopping assistant	A storefront helper can answer from catalogue and store-policy information available to the application. External AI responses depend on provider configuration; this is not a substitute for verified support.

Customer acceptance check Verify guest browsing and checkout, account sign-in and refresh persistence, product/variant selection, cart totals, payment success/failure behavior, order lookup, and ownership restrictions using approved test accounts and test payment credentials.

Admin dashboard & operations

The administration interface is served at **/admin**. Admin credentials are provisioned on the API host, and protected requests use a signed admin session. Actions that change catalogue, content, orders, or financial records are API-backed and audited where implemented.

Admin area	Current tools
Overview	Dashboard summary and store-operation entry points.
Products & variants	Create and edit products, category, copy, price, comparison price, SKU, image, tags, published/featured status, and variant-specific options, SKUs, prices, and stock.
Categories & collections	Manage categories and homepage collection/category cards; update images, captions, destination, product membership, display order, and storefront visibility.
Banners & policy pages	Manage promotional banners and published content/policy pages. Only published pages are returned by the public storefront endpoint. Publish only owner-approved copy.
Orders & tracking	Review orders and update status, courier name, and tracking number. Customer messages are sent when SMTP is configured. Live courier tracking events require a courier integration.
Returns & customer requests	Review customer cancellation/return/exchange requests and advance them through allowed workflow statuses with decision notes.
Refunds	Initiate eligible Razorpay refunds against verified captured payments. Uncertain provider outcomes are held for reconciliation; the admin must confirm status in Razorpay before retrying.
Customers & reviews	Review customer records and approve or reject submitted product reviews. Access is protected by admin authentication.
Coupons & sales reports	Create/enable/disable discount coupons and download a sales CSV report.
Audit trail	Record selected admin operations for accountability and follow-up.

Admin acceptance check Use a non-production admin account to verify access restrictions, create/edit/publish a test item or content record, confirm customer storefront updates after refresh, update a test order, review a customer request, and download/open a sample CSV.

Technology, data & deployment

Layer	Technology / responsibility
Web client	React 18, JavaScript/JSX, Vite, CSS, Lucide icons; responsive storefront and admin interface.
API	Node.js with Express 5; request validation with Zod; rate limiting and HTTP security headers.
Database	PostgreSQL, commonly hosted on Neon. Schema and setup scripts are in the repository. The Express API owns checkout, pricing, stock reservation, order creation, payment verification, and admin operations.
Identity	Supabase Auth for customer identity/session. API verifies customer tokens and scopes account endpoints to the authenticated customer. Admin authentication uses server-configured credentials and signed tokens.
Payments	Razorpay Node SDK and checkout flow. Private key material stays on the API server; webhook signature verification is supported. Test credentials and a configured webhook are prerequisites to payment acceptance.
Email	Nodemailer-compatible SMTP configuration for order and customer communications. Email delivery is unavailable until SMTP is configured and verified.
Images	Product and collection images can be supplied by URL or uploaded through the admin flow; image resizing is applied to collection uploads. Image hosting, rights, and backup strategy should be confirmed by the owner.
Operations	Vite build output for static hosting; Express API on a Node host; environment variables for secrets and provider credentials. Docker Compose can supply local PostgreSQL.

Items requiring owner / deployment confirmation

- **Production secrets:** configure database URL, JWT secret, admin email/password hash, Supabase URL and public key, Razorpay live key ID/secret/webhook secret, and allowed origins in the deployment environment. Never send secrets in this approval PDF.
- **Database security:** production currently uses PostgreSQL/Neon, not Supabase Postgres. Customer ownership is enforced by API queries; review database privileges and add/verify database-level least privilege and row protections before launch. Do not assume Supabase RLS protects Neon tables.
- **Fulfilment:** select and configure a courier provider for PIN serviceability, labels, pickup, and live tracking webhooks. Current tracking supports stored courier/tracking details, not a live carrier integration.
- **Business content:** owner approves actual product data, prices, images and rights, return/shipping/refund policy, contact details, taxes, shipping fees, COD policy, and customer communications.
- **External testing:** use staging database and Razorpay test mode for end-to-end orders and refunds. Confirm backups, monitoring, domain/HTTPS, allowed auth redirects, and production support coverage before launch.

This project source does not contain production customer credentials, production database content, courier credentials, SMTP credentials, or owner-approved final catalogue/policy materials. Their availability and correctness must be confirmed separately.

04 / SIGN-OFF

Client review & acceptance form

Please review the scope and record a decision. Approval confirms that the areas below have been reviewed in the agreed environment; it does not waive external configuration, security, or deployment prerequisites. Production release requires approved content, credentials, backups, security review, payment/webhook setup, and staging acceptance.

Review item	Customer experience approval	Admin / operations approval
Visual design & mobile layout	[ ] Approved [ ] Changes requested	[ ] Approved [ ] Changes requested
